INSTALLATION GUIDE

Thank you for choosing your new RAIS or ATTIKA product! This installation instructions manual will ensure that your fireplace insert is installed correctly and that it will provide you with comfort and pleasure for many years to come.

GENERAL INFORMATION

It is important to correctly install the fireplace insert out of consideration for both the environment and personal safety.

The installation must comply with all local rules and regulations, including those that refer to national and European standards. A certified chimney sweeper should be contacted before set-up.

No unauthorised alterations may be made to the fireplace insert.

GENERAL INSTALLATION REQUIREMENTS

Before the fireplace insert may be put to use, the set-up must be reported to your local chimney sweeper.

There must be a plentiful supply of fresh air into the room where the insert is placed to ensure good combustion, possibly through an AirSystem connection. Be aware that any mechanical air extraction, for example a cooker hood, can reduce the supply of air. Any air vent must be positioned in a way that ensures the supply of air cannot be blocked.

The air consumption of the fireplace insert is 37,5 m³/h.

The floor structure must be able to support the weight of the fireplace insert and a chimney, if required. If the existing floor structure does not meet this requirement, suitable measures must be taken (e.g. installation of a load distribution plate). If in doubt, contact a building expert.

NOTE!

RAIS/ATTIKA recommends having the insert installed by an authorised technician. Please ask your dealer for further information.

National and local regulations must be complied with, including the size of the non-flammable plate that must cover the flammable floor in front of the fireplace insert to protect the floor from falling embers.

The fireplace insert must be positioned at a safe distance from flammable material. Due to risk of fire, flammable items (e.g. furniture) may not be positioned closer to the insert than specified in the sections on placement. When deciding where to install your RAIS/ATTIKA fireplace insert, you should consider being able to heat other rooms in your home to get the most out of your new fireplace insert.

After receiving your fireplace insert, please check it for any defects.

CHIMNEY

As a minimum, the chimney must be constructed of T400-N1-D-50050-G100 flue pipe, and be tall enough that the draft conditions are in order, i.e. -12 pascal to -18 pascal. If the recommended chimney draught cannot be achieved, problems of smoke puffing from the door may arise when heating. We recommend adapting the chimney to the flue pipe collar. The collar is 200 mm in diameter.

If the draught is too strong, it is advisable to equip the chimney with a regulating damper. If a regulating damper is fitted, you must ensure that there is a free flow-through area of at least 20 cm² when the regulating damper is closed.

Remember: there must be unobstructed access to the access door on the chimney.

The length of the chimney, calculated from the top of the fireplace insert should not be less than 3 metres and must be at least 80 cm above the roof ridge. If the chimney is placed on the side of the house, the top of the chimney must never be lower than the roof ridge or the roof's highest point. Note that there are often national and local regulations relating to houses with thatched roofs.

The fireplace insert is suitable for being connected to a shared flue, but we recommend that the feed-ins are positioned to maintain a clearance-level difference of at least 250 mm between them.

TECHNICAL DATA

SPECIFICATIONS

Danish Technological Institute ref.: 300-ELAB-2646-EN

	VISIO UNIQ 3:1
Nominal output (kW)	11,3
Heating area (m ²)	180
Fireplace insert W x D x H (mm)	631 X 1062 X 1637
Combustion chamber W x D x H (mm)	237 X 638 X 234**
Min. flue draught (pascal)	-12
Weight (kg) min., depending on the model	318 kg
Efficiency (%)	76
CO emission attributed to 13% O ₂ (%)	0,0930 / 1162 mg/Nm ³
NOx emission attributed to 13% O ₂ (mg/Nm ³)	76
OGC emission attributed to 13% O ₂ (mg/Nm ³)	74
Particle emission in accordance with NS3058/3059 (g/kg)	6,57
Dust measurement in accordance with DIN + 13% O ₂ (mg/Nm ³)	36
Flue gas flow (g/s)	12,3
Flue gas temperature (°C)	262
Intended flue gas temperature (°C) at flue collar	314
Recommended wood volume (kg) for stoking the fire (Dispersed over three pieces of firewood)	3,0
Intermittent operation	Stoking should be done within 52 minutes

*Not verified by test.

**Max. load

DIMENSIONAL SKETCHES

The top section of the flue collar can be moved around in a radius of 149 mm around the centre of the flue outlet.

All dimensions are in mm.

* AirSystem

INFORMATION PLATE

INFORMATION PLATE

All RAIS/ATTIKA fireplace inserts have a rating plate specifying the distance from the fireplace insert to flammable materials, efficiency, etc. The rating plate is lying unattached in the fireplace insert upon delivery.

INSTALLATION

The following section explains how to install the fireplace insert and includes information about packaging, placement distances, etc.

PACKAGING AT DELIVERY

Upon delivery, the fireplace insert is secured to a transport pallet using four transport safety fittings. The safety fittings are attached with screws which must be unscrewed. The safety fittings can then be removed.

RECYCLING OF PACKAGING

The fireplace insert is delivered in recyclable packaging. This packaging must be disposed of in accordance with national regulations relating to the disposal of waste.

NB: DISPOSE OF THE FIREPLACE INSERT WHEN IT IS WORN OUT.

The glass is not recyclable. The glass must be disposed of along with any residual ceramic or porcelain waste. Heat-resistant glass has a higher melting point, which is why it is not recyclable.

By ensuring heat-resistant glass does not end up alongside recyclable products you are making an important contribution to the environment.

TRANSPORT SECURITY

IMPORTANT!

On delivery, the door is locked for transport and must be released before installation. This is done by removing the two transport screws in the counterweights on the back of the oven!

AIR CONCENTRATOR PLATE

IMPORTANT!

The oven comes with an air concentrator plate that must be removed before use.

The installation of Visio Uniq 3:1 may differ depending on the country in which it is installed. In Norway pursuant to Norway's open-plan office rules requires the insertion of a mechanical stopper in the flue. See the manual in Norwegian for more information.

CHOICE OF MATERIAL FOR INSTALLATION

The material can be panels/brick with an insulation value greater than $0.03 \text{ m}^2 \times \text{K/W}$.

The insulation is defined as wall thickness (in metres) divided by the wall's Lambda value.

Consult your installation technician/chimney inspector.

During testing, the fireplace insert is installed in a cabinet made of non-flammable 50 mm calcium silicate panels (Skamotec 225).

The stove comes with a flue collar that is 200 mm in diameter.

The flue collar can be changed from a top outlet to a rear outlet. Loosen the clamping strap on the outlet flange and adjust as preferred.

The fireplace insert must be placed on heat-resistant material.

See the following pages for installation dimensions and placement distances.

IMPORTANT!

As a minimum, the chimney must be constructed of T400-N1-D-50050-G100 flue pipe.

INSTALLATION DIMENSIONS INSULATED FLUE

INSTALLATION DIMENSIONS

Applies to installation into non-flammable panels.

Minimum cavity dimensions (H x W x D): . 560 x 631 x 887 mm

A fireplace insert must never be tightly inserted into a cavity, as steel expands when heated.

There must be a minimum convection air intake of 500 cm² underneath the stove and 700 cm² above it. The minimum convection-air areas above and below the stove can be distributed over several holes.

Distance	Dimensions mm
Distance from convection grate to flammable ceiling	380
Distance from lower door edge to flammable floor	410

SET-UP INSULATED FLUE

A non-combustible plate must be installed directly above the convection air draft.

ATTENTION!

The insulated chimney must extend all the way down to the flue outlet adapter.

SET-UP INSULATED FLUE

If the insulation value is complied with (greater than $0.03 \text{ m}^2 \times \text{K/W}$), the cabinet may be installed against a flammable wall provided that the interior distance from stove to cabinet is respected.

Minimum distance	mm
Distance from door to furniture	800
Distance from side glass to furniture	600
Interior distance to cabinet	100
Distance from vertical frame to flammable wall	100

Combustible

Not Combustible

INSTALLATION DIMENSIONS UN-INSULATED FLUE

INSTALLATION DIMENSIONS:

Applies to installation into non-flammable panels.

Minimum cavity dimensions (H x W x D): . 560 x 631 x 887 mm mm

A fireplace insert must never be tightly inserted into a cavity, as steel expands when heated.

There must be a minimum convection air intake of 500 cm² underneath the stove and 700 cm² above it. The minimum convection-air areas above and below the stove can be distributed over several holes.

Distance	Dimensions mm
Distance from convection grate to flammable ceiling	380
Distance from lower door edge to flammable floor	410

SET-UP UN-INSULATED FLUE

A non-combustible plate must be installed directly above the convection air draft.

ATTENTION!

The insulated chimney must pass through the non-combustible plate.

SET-UP UN-INSULATED FLUE

If the insulation value is complied with (greater than $0.03 \text{ m}^2 \times \text{K/W}$), the cabinet may be installed against a flammable wall provided that the interior distance from stove to cabinet is respected.

Minimum distance	mm
Distance from door to furniture	800
Distance from side glass to furniture	700
Interior distance to cabinet	100
Distance from vertical frame to flammable wall	100

EN

HEAT DISTRIBUTOR

HEAT DISTRIBUTOR

By installing a heat distributor unit above the fireplace insert, heat can be 'transported' to other rooms.

CONVERT TO SELF-CLOSING DOOR BEFORE BUILDING IN THE INSERT

Convert the door to self-closure by removing some of the door's counterweights. There are counterweights on both sides.

1. Remove the transport safety fittings and retainer screws for the counterweight cover
Transport safety fitting.

2. Remove the counterweight cover by pulling it up.
Counterweight cover.

3. Loosen the locking ring (2.5 mm hex key). Remove the number of counterweights that allow the door to close slowly and at a constant speed. Double-check the function.

4. Tighten the locking ring (2.5 mm hex key)

5. Attach the counterweight cover and the retainer screw(s).
Counterweight cover.

CONVERT TO SELF-CLOSING DOOR AFTER BUILDING IN THE INSERT

Convert the door to self-closure by removing some of the door's counterweights. There are counterweights on both sides.

1. Remove the side Skamol panel.

2. Remove the access panel.

Access panel.

3. Loosen the locking ring (2.5 mm hex key). Remove the number of counterweights that allow the door to close slowly and at a constant speed. Double-check the function.

Locking ring.

Counterweights.

4. Tighten the locking ring (2.5 mm hex key).

Locking ring.

5. Re-attach the access panel and side Skamol panel.

Access panel.

EXTERNAL AIR CONNECTION, AIRSYSTEM

All RAIS/ATTIKA fireplace inserts can have an external air connection for combustion. We call this external air supply AirSystem. The system can be connected to the underside of the fireplace insert.

DECLARATION OF PERFORMANCE
